European Project Continuing Education in Structural Connections

The European educational project Continuing Education in Structural Connections (CESTRUCO) was prepared by the European Convention of Constructional Steelwork (ECCS) Technical Committee TC10 “Structural Connections” to disseminate the European latest results in research and standardization during the period of transferring the European pre-standard into the European Standard. The aim of the project was to improve the competitiveness of the structural steelwork by the dissemination of the best European practice and knowledge in the structural connections.

The project was scheduled for three years and divided into following basic steps. The first step of the project was collecting the questions from European practice. Under the second step the answers to those questions were prepared in form of a printed educational manual. In the last step the material are disseminated into the European practice in the national languages of the participants of this project in form of an Internet course and a CD support of the education in structural connections. The outputs of the project may be found at the Internet page <http://web.fsv.cvut.cz/cestruco/>.
